

1. Handling Missing Values:

a) Checking Missing values in price column: First, I select the Price column and press Ctrl + G. Then I click Special, select Blanks, and click OK. This helps me identify all the products where the price information is missing.

b) Handling Missing Price: I assigned minimum price using the formula =MIN(D2:D35).

Thus, minimum price = 30.

Filled blank price cells with 30 using the formula =IF(D2=" ",30,D2)

Also, while copying and pasting values, I have used - ' Paste Values Only' function.

c) Dealing products with Missing Categories: I check the Category column for missing values. If I cannot identify the correct category from the product information, I replace the missing value with "Unknown" rather than assuming a category. This helps avoid incorrect classification.

Filled blank price cells with "Unknown" using the formula =IF(F2=" ", "Unknown", F2)

Also, while copying and pasting values, I have used - ' Paste Values Only' function.

2. Correcting Inconsistent Data:

a) Identifying Text inconsistency in Product name column: Identified Text inconsistency and used formula =PROPER(TRIM(B2)) to correct it.

b) Identifying Typos Present in the Category column and fixing the issue: I apply a filter to the Category column and check the unique category names for spelling mistakes or variations. After identifying the typos, I use Find & Replace to correct them and maintain consistent category names.

c) Use the find and replace function to standardize the text formats in the "Product Name" column: I select the Product Name column and press Ctrl + H to open Find and Replace. I enter the incorrect text or format in Find what and the correct version in Replace with, then click Replace All. I repeat the same process for the Category column to correct any spelling mistakes or typos.

3. Removing Duplicates: I select the entire dataset and go to Data → Remove Duplicates. I select all the columns so that Excel compares the entire row, then click OK. Excel identifies and removes any rows that are completely identical.

4.

- A) Splitting Product ID column into two – Manufacturing Date and Country Code:

For Manufacturing date, I have used the formula =TEXTBEFORE(A2,"-",2)

For Country code, I have used the formula =TEXTAFTER(A2,"-",2)

- b) Merging – Product Brand: I create a new column named Product Brand and use the CONCATENATE function or & operator to combine the Brand Name and Product Name. For example, if Brand Name is in A2 and Product Name is in B2, I use =A2&" "&B2. Then I drag the formula down to merge the values for all rows.

5. Number Formatting:

- a) I select the Price column and go to Home → Number Format. Then I choose Currency and select the appropriate currency, such as ₹ (Indian Rupee). This formats all the price values as currency.
- b) Manufacturing Date - "DD-MM-YYYY" format:
First, I have used the formula
=DATE(2026,MONTH(1&MID(A2,4,3)),LEFT(A2,2)). I got it in the format
28/01/2026.
Then, I select the result cell and press Ctrl + 1 to open the Format Cells window. Then I choose Custom, enter dd-mm-yyyy in the Type box, and click OK to display the date in the required format.

6. Conditional Formatting:

- a) Applying data bar or color scales conditional formatting in the "Price" column: I select the Price column and go to Home → Conditional Formatting. Then I choose Data Bars or Color Scales and select a suitable style. This visually highlights the price values, making it easier to compare lower and higher prices.
- b) Creating a custom rule for conditional formatting in the "Category" column to highlight cells where the category is "Electronics.": I select the Category data range, go to Home → Conditional Formatting → New Rule, and choose Use a formula to determine which cells to format. I enter the formula
=E2="Electronics", choose a fill color under Format, and click OK. This highlights all the cells containing Electronics.
